

# Graphene coated sensor yarn for composite preforms

Anura Fernando, Sammia Ali , Sirui Tan, Guanliang He

The University of Manchester

1

# Textiles based composites

- **Textile based composite Structures:**

A composite structure is a combination of two different materials;  
Reinforcement + Matrix.

Reinforcement = Unidirectional, Bi-directional, Woven, knitted.

Matrix = Resin = Thermoset or thermoplastic.

- **Structural properties:**

Strong, light weight, high strength and stiffness.

some applications, Aerospace, automobile & sports goods.

<http://www.sciencedirect.com/science/article/pii/S0376042110000369>

<http://www.sciencedirect.com/science/article/pii/S0376042105000448>

# Limitations of composite structures

- Damage initiation and progression is a complex process.
- Delamination start at micro scale and can be remain hidden.
- **NDT methods**

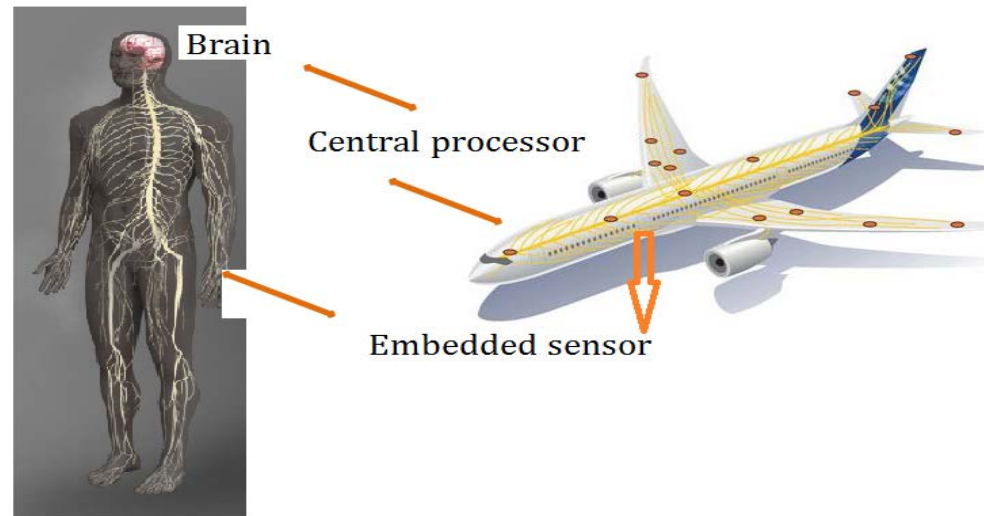

Visual inspection, Acoustic emission, Ultrasonic , radiography, thermography.

**Limitations:** performed at scheduled intervals,  
expensive (time consuming+ laborious).  
damage could remain hidden for some time.

- Prediction of damage is a challenge.
- Need to develop systems which can monitor the state of health.

# Multifunctional structures

- Multi-functional composite structures offer multi-features and can perform more than one function.
- Smart structures act as an monitoring structure and can sense external stimuli, like pressure, temperature etc.
- Possible by integration of sensors.
- Synonymous to a human body.

**Concept of health monitoring to a human nervous system**

Part of picture taken from <http://www.compositesworld.com/articles/structural-health-monitoring-composites-get-smart>

# Literature gap

- Sensors are added mostly within the rigid composite structure.  
Thermoset and Thermoplastics resins used.
- Similarly, little work is carried out in developing flexible smart composites.
- The aim of this research is to compare existing sensor material against graphene coated sensor yarn.
- Sensor type = *yarn based*.  
share same geometrical makeup.
- Textile technological process (*weft knitting*) is used for sensor integration).
- Focus on the how the sensor functions inside the composite.
- Characterisation = strain sensor/ pressure sensor.

# Types of sensors used for monitoring composites

- **Optical fibres**

- **Preform as sensor.**

**Conductivity of carbon fibre**

- **Electro-conductive yarns.**

**carbon fibre yarn, metal coated yarn, electro-conductive material coated yarn .**

- **Piezo electric/piezo ceramics sensors.**

**Synthetic: PZT (lead zirconate titanate), (BaTiO<sub>3</sub>), PVDF etc.**

**Can be surface mounted or embedded.**

# Sensors in composites

**Glass Optical fibre**

**Aracon (Nickel coated by CVD on high performance fibres).**

<http://www.conductivecomposites.com/fibers.html>

**Piezo-electric based sensors**

**PVDF strips co-woven during preforming.**

[http://link.springer.com/chapter/10.1007/978-90-481-3771-8\\_25#](http://link.springer.com/chapter/10.1007/978-90-481-3771-8_25#) cited on 12<sup>th</sup> June 2014

# Sensor yarn materials

**Continuous filament  
carbon fibre sewing  
threads (TIBTECH,  
Carbon Tenax)**

**Metallic coated  
sewing threads  
(TIBTECH,  
Silverpam 250)**

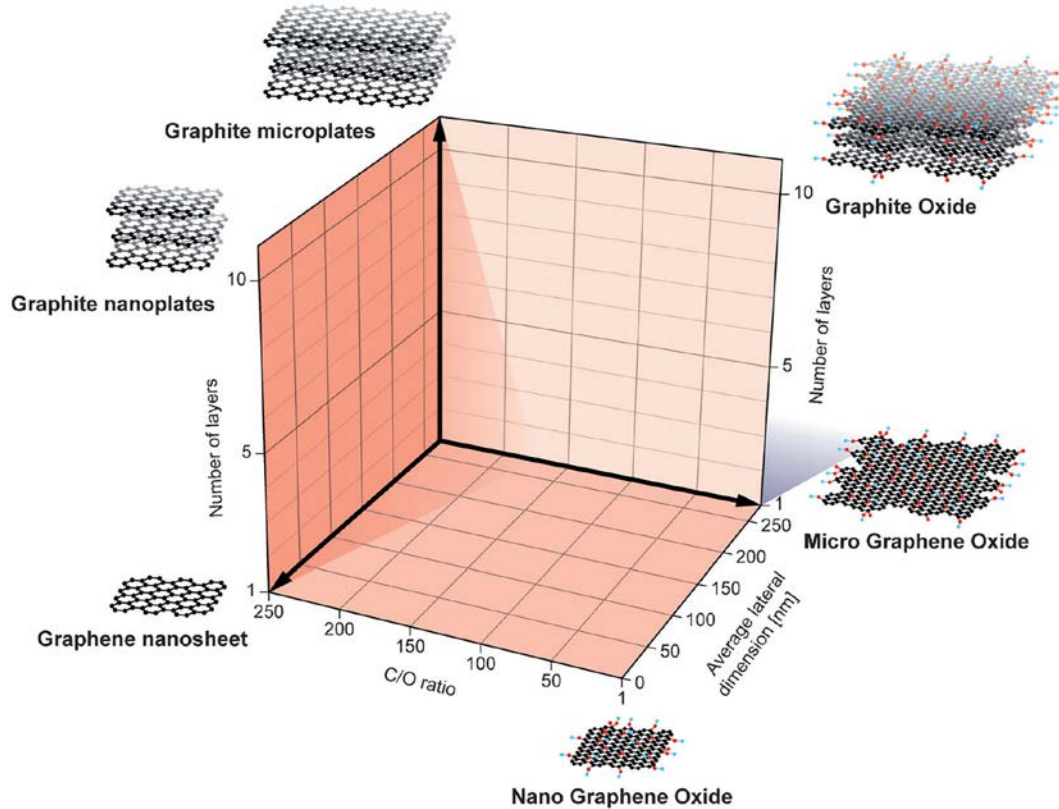

**Bekinox® VN14/2x90/175S/316L  
Stainless steel continuous filament yarn**

**Graphene-  
coated yarns**

# Graphene

Classification for different graphene-type materials is based on the number of layers, the C/O ratio and the lateral dimensions, from Ref. [37].

# Graphene for wearable sensing

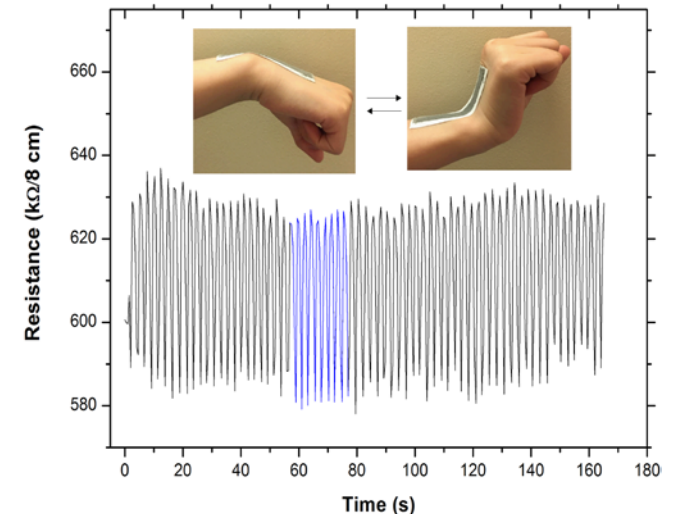

## Wearable sensing research

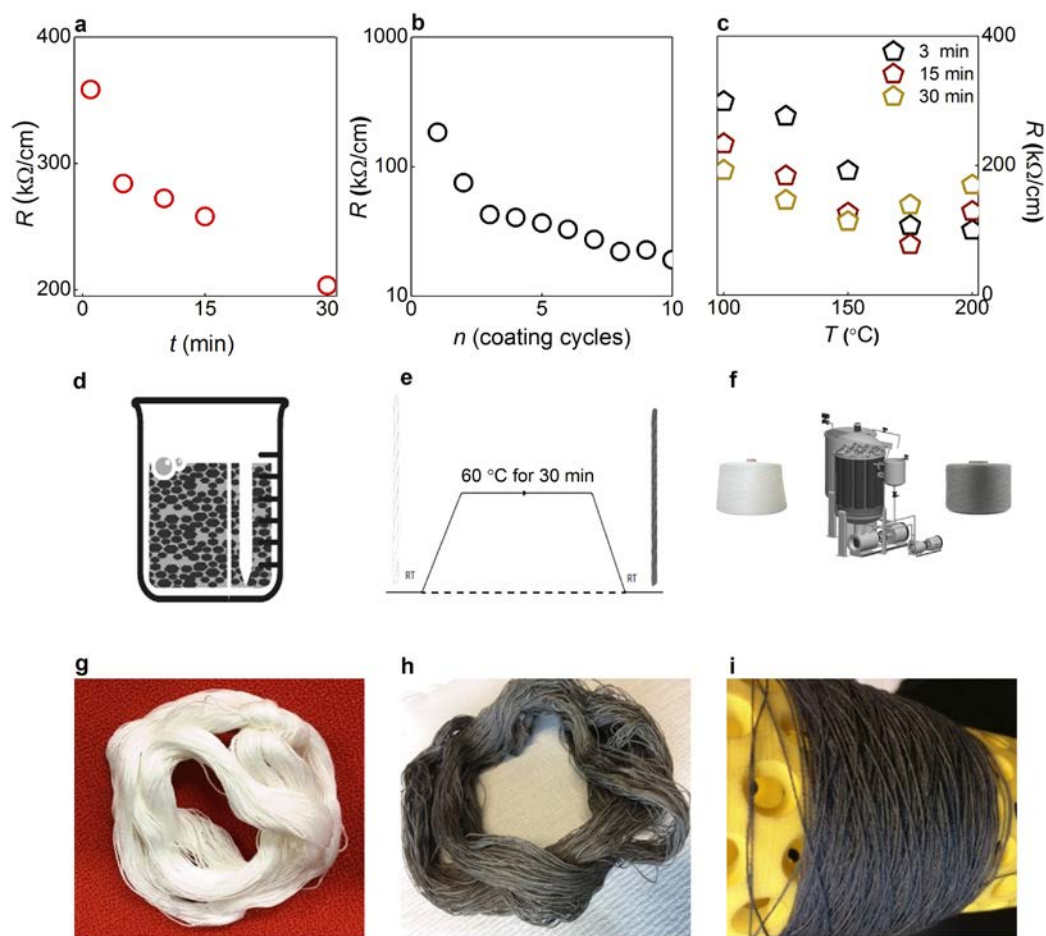

### Material development

Metallic compound based textile sensing materials

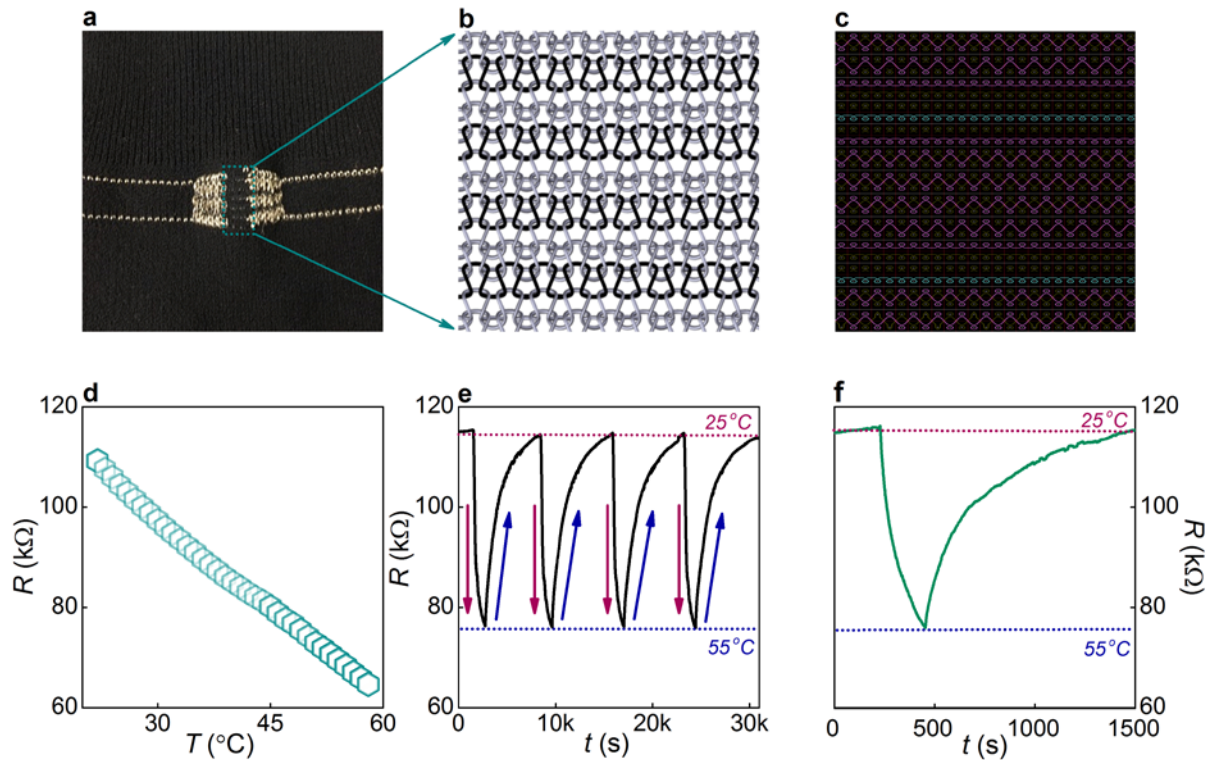

2D materials based textile sensing materials

### Technology development

**Optimisation of rGO coating. a)** The change of resistance of rGO (SH) yarn with coating time. **b)** The resistance of rGO (SH) coated and dried (at 100 °C) yarn Vs number of coating cycles. **c)** The change of rGO (SH) yarn resistance with curing time and temperature. **d)** Rapidly reduced graphene oxide rGO (SH) ink. **e)** A dyeing cycle diagram of textile yarn with rGO (SH) at 60 °C for 30 minutes. **f)** A commercial yarn dyeing machine which could potentially dye tonnes (~1,000 kg) of textile yarn (in packages). **g)** Undyed hank of scoured-bleached control cotton yarn. **h)** A hank of rGO dyed (coated) cotton yarn. **i)** Highly flexible graphene-coated yarn wrapped around a cone.

***Fabrication and characterisation of knitted graphene sensors*** **a)** Knitted temperature sensor with graphene coated yarn. **b)** Knitted structure used as a scaffold for the placement of graphene yarn as temperature sensor. **c)** Yarn path notation diagram for knitted temperature sensors. **d)** Temperature dependence of the resistance of knitted sensor showing almost linear change with negative temperature co-efficient. **e)** Cyclic test of knitted sensor's temperature sensitivity between 25 and 55 °C shows excellent repeatability. **f)** Time response property of knitted temperature sensor.

# Theoretical aspects

Resistance of an electrical conductor is given by

$$R = \rho \frac{L}{A} \text{ ----- (1)}$$

R = electrical resistance in the conductor

$\rho$  = electrical resistivity of the material

L = length of the electrical conductor

A = electrical current carrying area

$$R_c = \frac{\rho_m}{2} \left( \frac{\pi \rho_f}{W} \right)^{\frac{1}{2}} \text{ ----- (2)}$$

$R_c$  = contact electrical resistance between filaments

$\rho_m$  = volume resistivity of the materials

$\rho_f$  = hardness in the contact due to constrictive forces  
between conductors

W = contact force

# Theoretical aspects

Relative resistance change per unit initial resistance =  $\frac{\Delta R}{R_0}$

$\Delta R$  = change in resistance

$R_0$  = initial resistance

$$GF = \frac{\Delta R}{R_0} / \varepsilon$$

GF = gauge factor

$\varepsilon$  = strain in the yarn

# Experimental design

Yarn path notations for the sensor yarn integrated full Milano structure

Full Milano structure with the single sensor yarn

# Morphology of the sensor yarn

Two-ply continuous filament SS yarn **(a)** at 100x magnification; **(b)** at 4000x magnification

Continuous fibre silver coated polymeric yarn **(a)** at 200x magnification; **(b)** at 2000x magnification

# Morphology of the sensor yarn

Continuous fibre carbon yarn (a) at 200x magnification;  
(b) at 2000x magnification

Graphene coated cotton yarn (a) at 200x  
magnification; (b) at 2000xmagnification

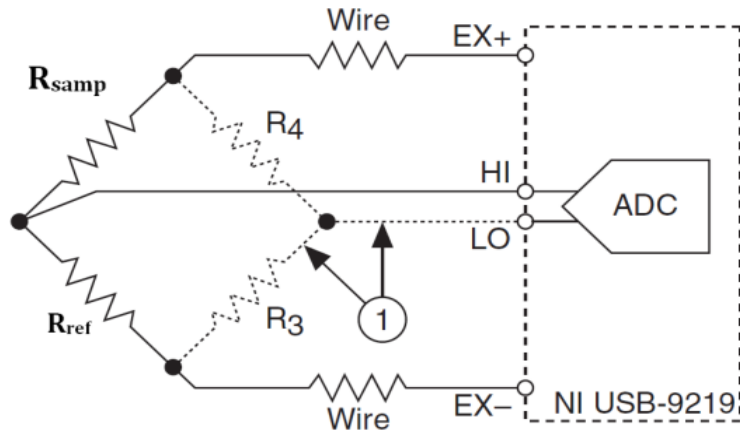

# Comparison of the sensor yarns

For the stainless steel yarn, the tenacity was 18cN/Tex where the fineness of the Stainless Steel yarn was 250Tex

## Mechanical properties for the electro-conductive sewing threads

Sensor yarn	Young's modulus (pa)	Break point (N)	Elastic limit (%)
Graphene	1692.31	2.8	0.52
Carbon	26800	52.4	1
Silver	190	7.6	10

# Electromechanical Characterisation

$$R_1 = R_{\text{samp}} \quad \& \quad R_2 = R_{\text{ref}}$$

Half-bridge circuit diagram with NI-9219, Full- lines representing external circuit while (1)- dotted lines represent the circuitry connected inside the 9219-module, source from National instruments ([Instruments, 2011](#))

$$R_{\text{ref}} = \sqrt{R_{\text{samp}@minvalue} * R_{\text{samp}@maxvalue}}$$

$R_{\text{sample}}$  = With an accuracy of  $\pm 0.5 \Omega$ s

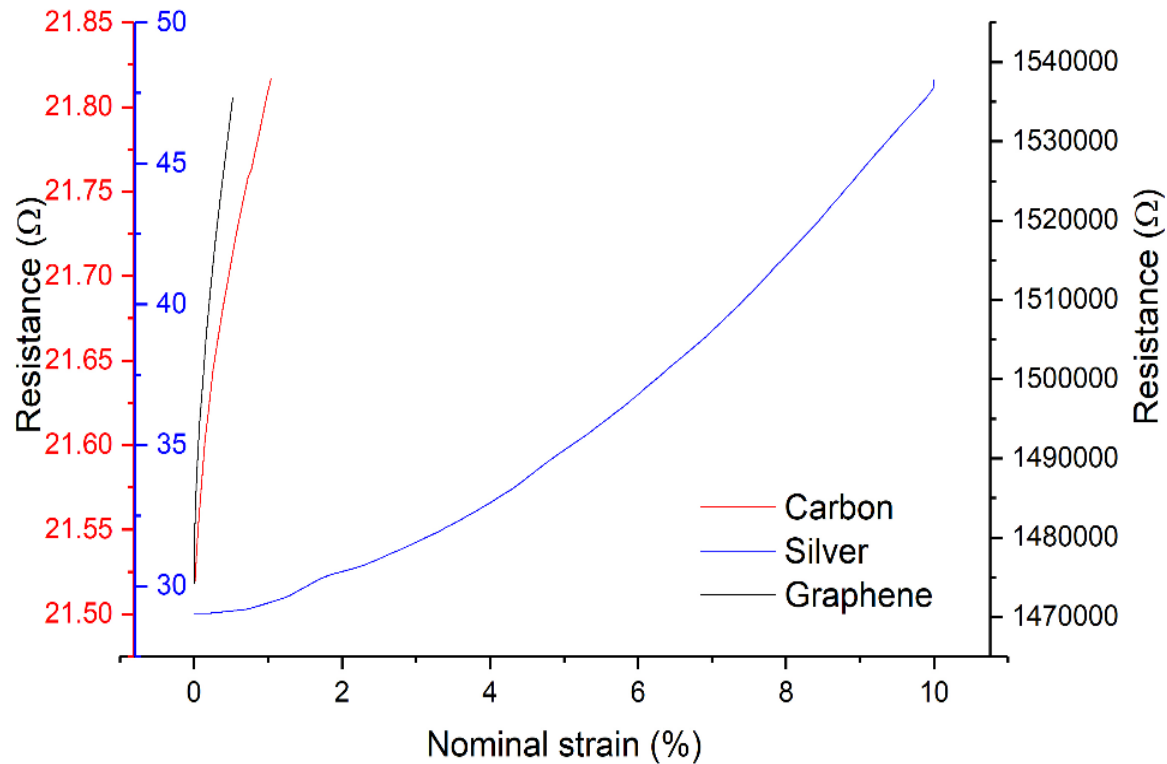

$$R_{\text{sample}} = \frac{R_{\text{ref}} - 2 * NI_{9219\text{reading}} * R_{\text{ref}}}{2 * NI_{9219\text{reading}} + 1}$$

Sample

Lab view Signal express to acquire the data

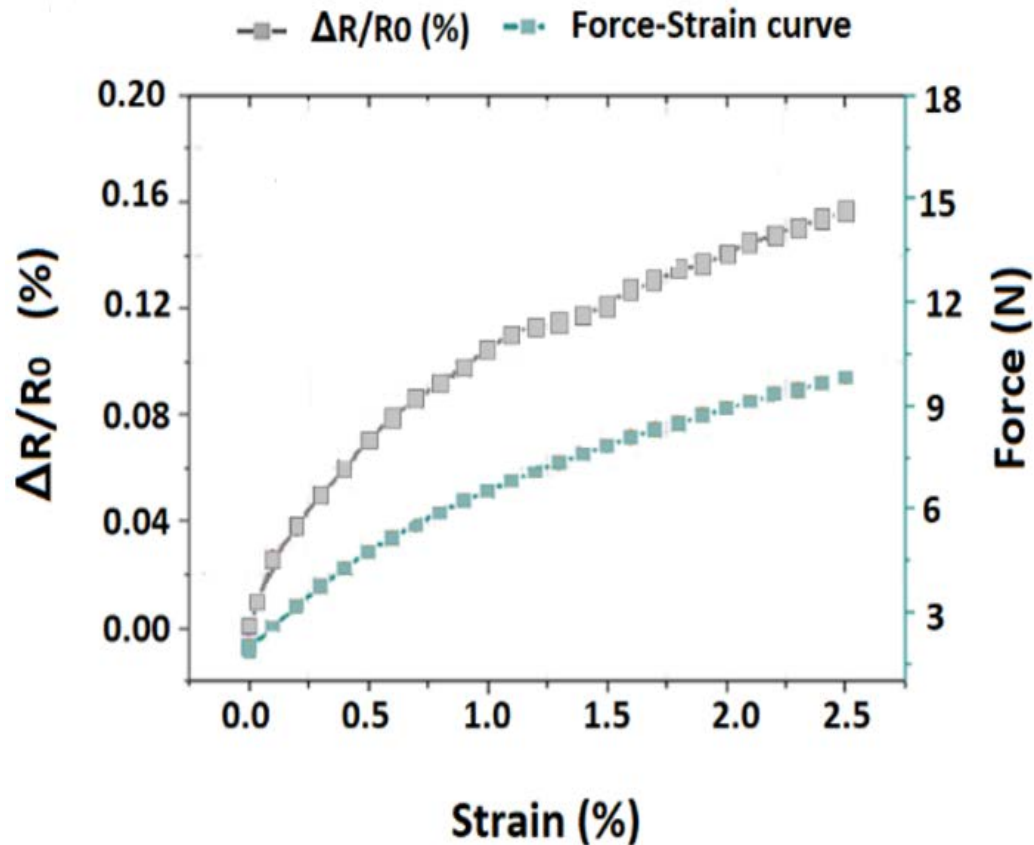

# Comparison of sensor yarn

Electrical resistance of silver, carbon and graphene sensor yarn against strain experienced

# Results and conclusions

## Stainless steel yarn integrated composite testing

- Electro-mechanical testing
- Zwick Roell Z050 tensile machine. 10KN load cell.
- Rate = 2 mm/min.
- Gauge length = 100 mm.
- Number of samples= 6

# Conclusions

**Results showed that instead of tensile loading of the sensor yarn, using compressive loading to measure the tensile strain gives better results for graphene coated yarn.**

**These results show that by designing the graphene coated sensor in a more efficient way, higher sensor sensitivities and gauge factors could be achieved.**

**Under compressive loading mechanism, the sensitivity of the graphene coated sensor yarn are far better than the other yarn tested.**

# Damage at microscopic level for the stainless steel yarn

*Sensor Design One Sample showing exfoliation within single filament, image taken at 8000X magnification*

*Sensor design One -- Crack within single filament, picture taken at 16000x.*

*Sensor design 1 stretched till 7% strain showing progressive exfoliation within each strand (SEM Image taken at 4000x Magnification)*

## Possible improvements

- Gauge factor improvement by changing design of sensing preform.
- Increase of flexibility range without avoiding permanent deformation.
- Use of fine Tex Glass yarn.
- Development of composite structure.
- Electromechanical characterisation.
- Further studies to evaluate the reliability of the sensing yarn.

End of presentation

Thank you!
